

Lean Transformation

While customer requirements or demand change frequently the processes to meet that demand often don't. Organisations evolve over time activities that become wasteful or don't add value to the changing customer demand. Transforming an organisation so its people continually review their processes and activities in line with their customers demand ensures that the minimum resources are used to deliver the best service.

The principle of any Lean Transformation programme is to firstly define the value-adding elements of a process, then link them to flow better whilst eliminating other waste activities.

Organising the process to run at the same pace as the demand of the customer prevents over production and other wasteful activities.

The continuous elimination of waste in a process requires focus by every member of the organization working together supported by a culture of continuous improvement.

Aspen Global's Lean Transformation programme is a structured approach to deliver significant business productivity savings and establish a culture of continuous improvement.

Our lean experts are skilled in supporting companies and developing your people through the implementation of Lean Practices in their processes at every level in the organization.
